

Zeroshell is a powerful and easy to install, easy to configure network tool.

We have Zeroshell installed as a bridge between a router (gateway) and a local network with more than 200 users, since may 2007.

The machine is a Intel(R) Pentium(R) 4 CPU 3.00GHz with 3GB of RAM, but it is over-sized because the CPU load never reach 0.20. ☺

We have the following features activated:

- DNS server
- Firewall
- QoS (P2P, http prioritization, low queues for high traffic consume abusing, etc)

And it rules OK!

If you are thinking about which *Network Appliance for servers and embedded devices* set up in your network... Zeroshell is the tool you need.

Any question? You can find in Zeroshell site a list of FAQ, documentation, other users contributions and an extensive forum (english/italian).
